PAB Board Cleaning & Maintenance

Before cleaning PAB Board, it is important to understand that the material is porous and can absorb liquids and debris. For this reason, it should be cleaned much like carpet: lift and remove as much debris or staining as possible, and avoid rubbing, which may push debris deeper into the board.

Dust Debris Removal:
Use a clean vacuum nozzle to gently remove loose dust and debris. Avoid compressed air, as it may drive debris deeper into the board and disperse dust into surrounding areas.

Stain Removal:
Liquid Stains

- Gently blot the area with a clean, absorbent towel to soak up as much liquid as possible. Once the excess has been removed, use a clean vacuum nozzle to extract any remaining moisture or residue.

Dry Stains

- Carefully pick away as much residue as possible without rubbing it into the board. Then use a portable carpet cleaner with distilled water to loosen and extract the remaining stain. Avoid hard or mineral-rich water, as it may leave discoloration.

Disinfect:
Follow CDC guidance when selecting an appropriate disinfecting solution for the type of contamination encountered. For routine disinfection, an over-the-counter antimicrobial fabric spray may be suitable. Always test any cleaning or disinfecting product on the back of the panel first to ensure it does not cause damage or discoloration.
